

A Retrieval

group-neutral query

Who performed better?

top- k retrieved set

any skew comes from the corpus

B Injection

matched pairs from the inventory

favours A

disfavours B

balanced across groups,
indistinguishable from clean text

C What a statistic then sees — same attacked set

the attack moves one dimension and leaves the other at its clean value

R1 group composition

unchanged

the count is balanced,
so a composition statistic reads clean

R2 within-group stance

clean

A
B

attacked

A down
B up

the stance is relocated,
so a difference between groups cancels
