

A. Retrieval

the statistic sees only this set, never the corpus

B. Pairwise injection

the two red items are the matched pair:
 A^+ favourable to A , B^- unfavourable to B

same templates as the corpus, so stance is unchanged

C. The two dimensions, and what the attack does to each

R1 group composition

$$\Delta_{R1} = \frac{1}{2} \sum_g |P_{\text{grp}}(g) - P_{\text{grp}}^*(g)|$$

composition of the retrieved set against the balanced reference

group A

group B

balanced by construction:
 $\Delta_{R1} \approx 0$
 the attack is invisible

R2 within-group stance

$$\Delta_{R2} = \max_{g \neq g'} |P_{\text{fav}}(g) - P_{\text{fav}}(g')|$$

stance gap between groups, which the injection relocates

favourable, A

favourable, B

relocated together:
 $\Delta_{R2} \rightarrow \max$
 the gap keeps the signal
